

Small-fruited Bulrush

(Scirpus microcarpus)

Perennial Grass

2' - 5' Tall

1' - 2' Wide

Full Sun

**Cutback in
Spring/Fall**

Zones 3 - 9

Small -fruited Bulrush is characterized by its distinctive flower clusters, which are small, brownish, and arranged in loose, branched panicles that give the plant a delicate, airy appearance. Blooming from late spring to early summer, the flowers develop into tiny, oval-shaped fruits that are a food source for waterfowl and other wildlife. The Small-fruited Bulrush plays a vital role in stabilizing soil and improving water quality in its native habitats, making it an ecologically significant species.
