

WATER BOY

HOW IT WORKS

Water Boy pH adjuster contains a proprietary blend of carboxylic acids, chelating agents, and ammonium sulfate designed to improve spray water quality. It works by lowering and buffering pH through carboxylic acids, binding hard water minerals with chelating agents, and enhancing nutrient and active ingredient uptake with ammonium sulfate. By reducing mineral antagonism and stabilizing pH, it helps maximize the performance of fertilizers and crop protection products. The degree of pH reduction will vary depending on the application rate and the initial water characteristics, with higher use rates generally resulting in lower final pH levels. In addition, the effectiveness of the pH adjuster depends on the salt content and initial pH of the water, so water testing is recommended to determine the proper use rate.

BENEFITS

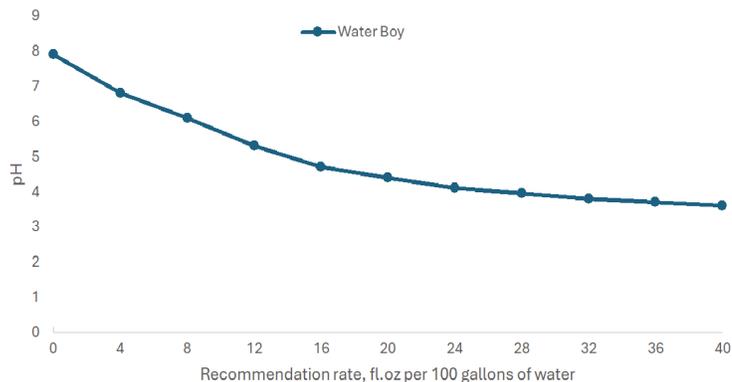

1. Improves spray water quality by lowering and buffering pH for optimal solution stability.
2. Reduces hard water by binding calcium, magnesium, and other minerals.
3. Enhances nutrient and active ingredient uptake for improved overall product performance.

SOIL AMENDING INGREDIENTS

Proprietary blend of carboxylic acids, chelating agents & ammonium sulfate100%
 NPE & APE FREE

USE RATES

fl.oz. of acidifier/100 gall of water	pH of water
